RFID Virus?

Hype today about [RFID Chips being infected with viruses](#), both [the Beeb](#) and [The Regis](#) picked up on this story, with the typical doomsday warnings, "Airports could be disrupted which of course is designed to make you think "planes will fall out of sky". Now the [academics behind this aren't saying that](#). Although the airport scenario is a bit far fetched.

As with all things technological this isn't a new threat, it's just a new vector", the excellent book [Writing Secure Code](#) by [Michael Howard](#), all about this, and conveniently the sample chapter at Microsoft "[All In Evil](#)" makes the point. Never trust input, no matter where it comes from.
